Pereira Chest Clinic, Station Road, Margao, Goa

Re: Mrs. Rosalind Maria Fernandes, 48 years, female (MCI Reg. No. MCI/26/02417)

Dear Dr. Pereira,

Thank you for referring Mrs. Fernandes, whom I saw today in the thoracic oncology clinic with her husband. She is a lifelong non-smoker and a school librarian, with a dry cough and left-sided chest pain for about two months. She had a hysterectomy for fibroids some years ago and has no other illnesses. She is ECOG 1, with decreased air entry at the left base and tenderness over the lower dorsal spine.

Her CECT thorax of 18/02/2026 showed a left upper lobe mass, and the CT-guided biopsy (HPE dated 26/02/2026) confirmed adenocarcinoma. The PET-CT done on 03/03/2026 shows left hilar and mediastinal nodes, a left pleural deposit and bone metastases (D9, right ilium, left 6th rib). Immunohistochemistry (12/03/2026) is ALK positive (D5F3) with PD-L1 TPS 30 %, and EGFR by RT-PCR is negative (report of 15/03/2026). A contrast MRI of the brain on 14/03/2026 showed a single 7 mm enhancing lesion in the right frontal lobe without oedema.

Assessment: Adenocarcinoma of the left lung, ALK-rearranged, stage IVB (cT2b N2 M1c, AJCC 8th edition), with bone, pleural and a single small brain metastasis.

Plan

- We plan to start alectinib as soon as the drug is available through the patient-assistance programme. Because of its good intracranial activity, the small brain lesion will be watched with an MRI after 8 weeks rather than treated upfront with radiosurgery.
- Bone-modifying therapy for the skeletal metastases after a dental check-up, with calcium and vitamin D.
- Baseline LFT, CPK, lipid profile and ECG before starting. I shall see her again on 30/03/2026.

I shall keep you informed of her progress. Please do not hesitate to call me if you need any further information.

With warm regards,

Dr. Sameer Kamat
