Tc-99m MDP WHOLE-BODY BONE SCAN

Patient:	**Mr. DEVI RAM**	Study No.:	**SNM/BS/26/0412**
Age / Sex:	72 Y / M	Date of study:	**13th April 2026**
Referred by:	Dr. R. S. Negi (Urology)	Radiopharmaceutical:	Tc-99m MDP 20 mCi IV; images at 3 h

Clinical details: Carcinoma prostate on TRUS biopsy (Gleason 8). S. PSA 86.4 ng/mL on 12/04/2026. Low back pain.

Findings

- Multiple foci of increased tracer uptake in the cervical (C6), dorsal (D7, D10) and lumbar (L2, L3) vertebrae, the sacrum, both iliac bones, the right 4th and 7th ribs and the proximal shaft of the right femur.
- Physiological tracer distribution elsewhere; both kidneys visualised; urinary bladder normal.
- No superscan appearance.

Impression

Multiple osteoblastic skeletal metastases involving the axial and appendicular skeleton (more than four lesions, including lesions beyond the vertebral bodies and pelvis), in keeping with high-volume metastatic disease. Suggest an X-ray or MRI of the right femur to assess fracture risk.

Dr. Ankita Sood
