HISTOPATHOLOGY REPORT

Patient Name:	**Mr. SUNIL DESHPANDE**	Lab No.:	**DH/26/05512**
Age / Sex:	61 Years / Male	Date Collected:	09/05/2026
Referred by:	Dr. Amit Kothari (Urology), Pune	Date Reported:	11/05/2026
Specimen:	Prostate - TRUS-guided core needle biopsies (12 cores)	Clinical details:	Raised PSA, 12 cores submitted

Gross examination

Received in formalin, 12 linear cores of tissue, each 0.8 to 1.6 cm long, labelled right base, right mid, right apex, left base, left mid, left apex (two cores each). All tissue submitted in 6 cassettes.

Microscopic examination

Sections show prostatic tissue infiltrated by a malignant glandular proliferation in 4 of 12 cores (left base, left mid, right mid). Neoplastic glands are small, fused and cribriform with a single cell layer. Perineural invasion is present. Maximum tumour involvement is 40% of the length of one core.

Diagnosis

Prostate, core needle biopsies: ADENOCARCINOMA, Gleason score 3 + 4 = 7 (Grade Group 2), involving 4 of 12 cores.

Perineural invasion present. No extraprostatic tissue sampled.
