MAMMOGRAPHY (BILATERAL) - REPORT

Patient Name:	**Mrs. SUNITA DESHMUKH**	Patient ID:	**VWI-24-02318**
Age / Sex:	50 Years / Female	Date of Study:	**18/11/2024**
Referred by:	Dr. Meena Pawar (MBBS, DGO)	Report Date:	18/11/2024

Technique

Digital mammography, craniocaudal (CC) and mediolateral oblique (MLO) views of both breasts. No prior studies available for comparison.

Findings

- Breast composition: heterogeneously dense (ACR category C), which may lower the sensitivity of mammography.
- Right breast: no mass, suspicious calcification or architectural distortion.
- Left breast: a small well-circumscribed oval mass of equal density in the upper outer quadrant at about the 2 o'clock position, measuring 9 mm. No calcification within it.
- Both axillae: no enlarged lymph nodes. Skin and nipples are normal.

Impression

BI-RADS category 3 (probably benign finding) in the left breast, upper outer quadrant. Short-interval follow-up with ultrasound and mammography in 6 months is suggested.

Mammography does not exclude malignancy. Clinical correlation is advised.

Dr. Anjali Mahajan
