HISTOPATHOLOGY REPORT

Patient Name:	**Mrs. SUNITA DESHMUKH**	Accession No.:	**NP/26/03317**
Age / Sex:	51 Years / Female	Specimen Received:	13 Mar 2026
Referred by:	Dr. Prashant Gaikwad, Triveni Multispeciality Hospital, Nashik	Reported on:	**18/03/2026**
Specimen:	**Wide local excision, left breast**	Clinical details:	Left breast lump, upper outer quadrant; wide local excision done on 12/03/2026

Gross examination

Received a single formalin-fixed wide local excision specimen of the left breast, 7 x 5 x 3 cm, with orientation sutures (short suture superior, long suture lateral). Cut surface shows an ill-defined, firm, greyish-white tumour measuring 2.3 cm in greatest dimension. The entire specimen is submitted in 14 blocks (A1 - A14).

Microscopic examination

Sections show an invasive carcinoma composed of cells arranged in cords, nests and glands, infiltrating fibro-fatty stroma. Tubule formation score 3, nuclear pleomorphism score 2, mitotic count score 1 (Nottingham score 6/9). Ductal carcinoma in situ, intermediate grade, cribriform pattern, forms about 10% of the lesion. No lymphovascular invasion is seen.

Diagnosis

Left breast, wide local excision: INVASIVE CARCINOMA OF NO SPECIAL TYPE (DUCTAL), Nottingham grade 2 (3 + 2 + 1 = 6/9). Tumour size 2.3 cm.

All margins are free of invasive carcinoma and DCIS. Closest margin: superior, 4 mm.

Comment

IHC: awaited.

Block A7 has been sent for ER, PR, HER2 and Ki-67. A supplementary report will be issued separately.
