HISTOPATHOLOGY REPORT

Patient Name:	**Mr. MOHAMMED ABDUL RAHIM**	Accession No.:	**KH/26/00874**
Age / Sex:	64 Years / Male	Date Received:	16/01/2026
Referred by:	Dr. Alok Shrivastava, Upvan Multispeciality Hospital, Bhopal	Date Reported:	**22/01/2026**
Specimen:	**Right hemicolectomy specimen**	Clinical details:	Carcinoma ascending colon

Gross examination

Received right hemicolectomy specimen: terminal ileum 8 cm, caecum, appendix and ascending colon 22 cm. A circumferential ulcero-proliferative growth of 4.5 x 4 cm is seen in the ascending colon, 6 cm from the distal resection margin. Growth extends into the pericolic fat. 14 lymph nodes are identified in the mesentery.

Microscopic examination

Sections show an adenocarcinoma of moderate differentiation infiltrating through the muscularis propria into the pericolic fat. Lymphovascular invasion is present. Perineural invasion is not seen. Both resection margins and the radial margin are free of tumour. 2 of 14 lymph nodes show metastatic deposits.

Diagnosis

Right hemicolectomy: ADENOCARCINOMA, moderately differentiated (grade 2), ascending colon, 4.5 cm. pT3 pN1b. Margins negative. Lymph nodes: 2 of 14 involved.
