HISTOPATHOLOGY REPORT

Patient Name:	**BHUPEN KALITA**	Lab Sl. No.:	**DHC/H/0218/26**
Age / Sex:	62 Yrs / M	Date of collection:	18-02-2026
Referred by:	Dr. Pranjal Baruah (Gastroenterology)	Date of receipt:	19-02-2026
Specimen:	Endoscopic biopsy, oesophagus at 28 - 31 cm from the incisors	Date of reporting:	**21-02-2026**

Clinical details

Progressive dysphagia to solids x 3 months, weight loss 6 kg. UGI endoscopy: ulceroproliferative growth in the mid-thoracic oesophagus, scope negotiable with difficulty.

Gross

Multiple grey-white soft tissue bits, aggregate 0.8 x 0.6 cm. All embedded (1 block).

Microscopy

Sections show oesophageal squamous mucosa with an underlying infiltrating neoplasm arranged in nests and cords. The cells show moderate nuclear pleomorphism, vesicular chromatin, prominent nucleoli and focal keratin pearl formation. Desmoplastic stroma is noted.

Diagnosis

Oesophagus (mid-thoracic), endoscopic biopsy: SQUAMOUS CELL CARCINOMA, MODERATELY DIFFERENTIATED.

Note: kindly correlate clinically and radiologically.
