CT THORAX (PLAIN + CONTRAST)

Patient:	**TENZIN DORJEE BHUTIA**	Patient ID:	**LID/26/09-0117**
Age / Sex:	51 Y / Male	Date:	**02-09-2026**
Ref. by:	Dr. Sonam Tobgay (Pulmonology)	Indication:	Chronic cough, haemoptysis x 2 weeks; smoker

Observations

- A 3.8 x 3.2 cm spiculated soft-tissue mass in the posterior segment of the right upper lobe abutting the oblique fissure, with heterogeneous enhancement.
- Enlarged right hilar (16 mm) and subcarinal (14 mm) lymph nodes.
- Emphysematous changes in both upper lobes. No pleural effusion.
- Mediastinal vessels normal. Visualised upper abdomen unremarkable.

Impression

Spiculated right upper lobe mass with right hilar and subcarinal lymphadenopathy, suspicious for bronchogenic carcinoma. CT-guided biopsy or bronchoscopy is suggested.

Dr. Anjali Pradhan
